Easilys 0.815.0

2026-09-21

The changes and bugs corrected in versions 0.810.1 and 0.810.2 are included in this version.

General

Features

· #47660: ⛔ [ALPHA] *Feature not available.* The Ma Cantine dashboard export is generated by a background task instead of blocking the HTTP worker, enabled by the config key ASYNC_REPORT_GENERATION_IS_ACTIVE.

Bug fixes

· #52141 (V0.810.1): 🔧 Fix wrong pkg compilation of pg-boss on build phase.

Rights changes

· #47660: New right "Download the file produced by a task" (GET /async-tasks/#/download), assigned to the Home page so a user can download the file produced by their own task.

· #49202: New right "Enqueue an asynchronous large dashboard export" (POST /dashboard-cube/site/#/export-async), assigned to the same pages as the existing POST /dashboard-cube/site/#/export action.

Sites

Easilys Analytics

Bug fixes

· #49306: Saving the access rights of a dashboard no longer removes the sites or user profiles which were not displayed in the selection lists, and applying access rights to several dashboards at once now always asks for a confirmation.

Rights Management BETA ⛔ screen not yet available

Features

· #44551: ⚠️ The Comparator is now displayed immediately with "All profiles", six individual profile slots and the current user's profile selected by default. Profiles can be added, replaced or removed directly from the comparison columns.

· #51805: ⚠️ Right labels have been reviewed and standardized to make them clearer.

· #49413: ⚠️ In the 'Profiles' and 'Comparator' tabs, rows that have been edited but not saved are now highlighted with yellow stripes, so you can spot them before saving or cancelling. The 'BETA' tag now has a purple background.

· #49683: ⚠️ The "Activate all" option is now called "Enable all", and a confirmation message is displayed after enabling or disabling all screens and rights of a profile.

· #51952: ⚠️ By default, technical "application foundation" rights are hidden in Rights Management (By profile and Comparator tabs); administrators can display them with the "Application foundation" filter tag.

· #47848: ⚠️ Clicking the shared-right icon now fills the search field with the right label and immediately filters the list, allowing users to quickly locate all screens where a shared right is used.

Bug fixes

· #49573: The label search field is now always visible in Profiles, Comparator and My Rights, with a "Search" placeholder when empty. The button used to close the search bar has been removed, and clearing the search keeps the field visible.

Call for tenders

Call for tenders

Bug fixes

· #51529 (V0.810.1): Suppliers can once again type a tender price whose first decimal is zero (e.g. 12,05 or 12.05): the decimal separator and the zero are kept and the price is saved.

Products

Analytical group

Bug fixes

· #49736: A default tax can no longer be saved on a "Product" type analytical group (only "Off product" groups have one); affected existing groups have been corrected automatically. This inconsistency could double net amounts in the invoice export.

Menus

Dashboard

Features

· #49202: ⛔ [ALPHA] *Feature not available.* Large dashboard exports are submitted as a background task (currently only for the Ma Cantine dashboard), with a notification panel in V1 and V2 screens to track progress and download the result once ready.

· #49203: ⛔ [ALPHA] *Feature not available.* The background export task queries Omnisci directly so calculated cube columns are preserved, enforces a configurable row limit, and generates the file via Carbone or a streaming CSV writer for very large results.

Supplier orders

Order preparation v2 BETA ⛔ screen not yet available

Features

· #51286: ⛔ Order preparation results display adjustments (amounts with 2 decimals, labels, tooltips, alignment).

· #51357: ⛔ Order preparation v2 adjustments to calculation, order generation and site switching (totals, criteria shown in multi-site mode, data refresh when switching site).

· #52864: ⛔ Distinguish the amount to order from the estimated requirement on the order preparation results.

Bug fixes

· #51356: Order preparation quantities are now entered in ordering units instead of production units. Quantities are automatically rounded according to the product configuration.

· #51958: Site selection in the sites tree is now more granular. When more than 10 sites are selected, the selected items list is collapsed.

· #51860: ⛔ Order preparation v2 now shows products that cannot be ordered as unselected and unselectable, and indicates why: no matching supplier product, no compatible delivery date, or requirement already covered by stock or pending orders.

Rights changes

· #51357: Right "Allow multi-site order preparation" has been added. Profiles with this right can prepare multi-site supplier orders from Order preparation v2.

Receptions

Bug fixes

· #52456 (V0.810.2): Deleted credit requests are no longer recreated when manually validating a receipt.

· #52527 (V0.810.2): Some receipts could no longer be validated ("[object Object]" error). Validation works again and, in case of error, the actual message is now displayed.

· #52527 (V0.810.2): Manual receipt validation no longer auto-creates product claims on save; only claim data entered by the user is persisted (regression since #50762).

· #52527 (V0.810.2): On validation, only the receipt's global claim is finalized: empty drafts (no criteria, no product claim) are deleted, drafts with criteria move to "Generated", and no global criteria are added automatically.

· #51917: 🔧 Fixed supplier price without markup on receipt lines when delivered prices are manually adjusted, so delivered and supplier prices stay consistent in integration scenarios (including added, substituted, and updated products).

Supplier invoices

Bug fixes

· #51375: A forecasting invoice created when validating a receipt or a claim is now automatically associated with the supplier invoice already received for that document.

· #51579: A credit forecasting invoice (negative amount) now keeps its negative amount after being matched with a supplier credit note.

· #49736: Fixed duplicated analytical group net amounts (HT) in the invoice export API.

Supervision of order dispatch

Features

· #26212: ✔ From the order dispatch supervision screen, users can now select several "Not sent" orders and set them to "Sent" in bulk.

Stock

Inventories v2

Bug fixes

· #45220: 🔧 When creating a global end-of-month inventory, the warning about receipts still in progress now uses the selected inventory date (all in-progress receipts on or before that date), instead of staying on the current month.

Tools

Imports / Exports

Features

· #51966: ✔ supplier-product-v2 import supports fieldsNotToUpdate on update: units (extId*/id*), codeInternalSupplierProduct, referenceSupplierProduct, nbProductionPerOrder, nbStoragePerOrder, isDecimalAllowed, preOrderDelay, minOrderQuantity, packagingLevel.

Bug fixes

· #51699 (V0.810.1): 🔧 Fixed a timeout on the supplier-product (v1) import with large files, which prevented prices and products from being updated.

· #50742: Industrial product import no longer fails when packaging units are already linked to supplier products. Unchanged packaging is kept; packaging removed from the file is deleted correctly.

· #49802: Supplier product v2 imports now accept minOrderQuantity equal to 0, matching the export and the meaning of no minimum order quantity.

· #53243: Reverted the idDish unification by id/extId on the POSProduct import, which caused the POS product flow imports to fail.
