Easilys 0.835.0

2026-11-23

The changes and bugs corrected in versions 0.830.1 and 0.830.2 are included in this version.

General

Features

· **#57865**: 🔧 Improved login performance under heavy connection load. Added a composite index on UserConnection(idUser, dateConnection) and replaced OR conditions with UNION in the user lookup query. Login SQL time reduced from 625 ms to 1.1 ms on a large customer database.

· **#57646**: 🔧 Updated underscore, a library used for CAS sign-in (passport-cas), to a more recent version. There is no change for users.

Bug fixes

· **#57962** (V0.830.1): Users are no longer sent back to the home page or shown a page reload when a background request briefly fails because of a network issue; they now stay on the screen they are working on.

· **#58484** (V0.830.2): Fixed a single sign-on (SSO) issue where retrying a login could crash the application and, in some cases, create a user account without consent.

· **#57651**: 🔧 Fixed critical security vulnerabilities in karma, used to test the client. There is no change for users.

· **#57650**: 🔧 Fixed a critical security vulnerability in minimist, a library loaded with the application. There is no change for users.

· **#58046**: 🔧 Fixed usage of the classic screens (e.g. supplier orders, receipts, menus) no longer being recorded in the usage analytics.

· **#57811**: Fixed the support chat button doing nothing when connected through MAPAL OS: clicking it opens the support conversation again.

Site parameters

Users

Bug fixes

· **#57004**: Administrators can now see users whose profiles have different rights and assign those profiles when creating or updating users, including profiles from parent sites.

Sales price

Bug fixes

· **#58134**: Editing a tax rate entered with a decimal comma (for example 5,5%) now keeps the exact rate instead of rounding it down to 5%, so invoice VAT amounts are correct.

· **#58139**: Fixed the price shown as including VAT in the "Add a recipe" window of recipe groups, which actually displayed the price excluding VAT.

Sites

Rights Management

Features

· **#57224**: ✔ The Profiles tab displays profiles, screens, and rights with less spacing, so more entries fit on screen.

· **#57229**: ✔ Screens and rights that arrived with the last update of the instance show a green "New" tag (hover it to see the version they are available from), in the Profiles tab and in the Comparator. A "New" option in the Filters panel shows only these screens and rights. The tags are recomputed at each update, however many versions were skipped.

Bug fixes

· **#57004**: Administrators can now see every profile from their site and parent sites, including profiles with additional or retired rights. When opening a profile, they see only screens shared with their own profile and can view and edit every right on those screens. The Super Admin profile remains visible only to Super Admin in the list and rights APIs, and My Rights shows its complete implicit access.

· **#59049**: When an administrator opens a profile that has no screen, or none in common with their own profile, the screens area now shows "No screens available" or "No screens in common" instead of staying empty.

Products

Products administration - V2

Bug fixes

· **#57617**: On a supplier product sheet, the Packaging size list offers None, Small, Medium and Large again and can be changed.

Item administrations

Bug fixes

· **#58134**: Editing a tax rate entered with a decimal comma (for example 5,5%) now keeps the exact rate instead of rounding it down to 5%, so invoice VAT amounts are correct.

Product families administrations

Bug fixes

· **#58134**: Editing a tax rate entered with a decimal comma (for example 5,5%) now keeps the exact rate instead of rounding it down to 5%, so invoice VAT amounts are correct.

Recipes

Recipes management

Bug fixes

· **#56958**: Fixed the recipe photo appearing shifted upwards on the standard recipe sheet; the sheet layout and footer are restored.

Supplier orders

Supplier orders

Bug fixes

· **#58484** (V0.830.2): Fixed an application crash when printing supplier orders for a period without any order: a "No order" message is now displayed.

· **#58484** (V0.830.2): Fixed supplier order sending that could stay blocked indefinitely after an application crash or a blocked database query: sending now resumes automatically.

· **#58766** (V0.830.2): Fixed purchase card payments where the payment page showed an empty amount and refused the payment on the first attempt after the order cart was edited.

Receptions

Features

· **#55796**: ✔ Recording the actual origin of the delivered goods on receipt batches is now available (it was not yet active in version 0.830.0). The product's origin itself stays unchanged, and the right "Allow editing the origin of a received product" applies.

Bug fixes

· **#59020** (V0.830.2): Fixed the "Lots" tab of a received product that did not open and left the claims content displayed.

Control on reception

Features

· **#55796**: ✔ In Control on reception, the batch origin field is now called "Actual origin": existing batches show the origin saved on them (unknown if none was recorded) instead of the product's origin, and a new batch saved without an origin gets the product's origin (it was not yet active in version 0.830.0).

Claims

Bug fixes

· **#58268**: Fixed the claims list, where the status label could be squeezed onto the same line as the claim number.

Credit note requests

Bug fixes

· **#58268**: Fixed the credit note requests list, where the status label overlapped the amount and made it unreadable.

Dashboards

Features

· **#55798**: ✔ Purchase dashboards (including Ma Cantine) gain new widgets analysing the actual origin recorded at reception, the origin shared by all the batches of a received product, alongside the product's origin, which is now labelled "theoretical origin" for clarity. Previously available figures and historical reports remain unchanged.

Shipment

Packaging and logistics

Features

· **#55636**: ⛔ The dispatching plan shows, under each recipe name (and under "Replaces …" when present), its allergens ("Allergens: …" or "No allergens") and, when any, "May contain traces of: …". An allergen already listed is not repeated in the traces. Same rules as the packaging plan. This feature cannot be used in production yet: it is switched off and only switched on in development environments.

Tools

Tasks

Bug fixes

· **#58484** (V0.830.2): Fixed an application crash when running a task whose request contains several statements: the result of the last statement is now returned.

Imports / Exports

Bug fixes

· **#58282** (V0.830.1): Supplier products import no longer rejects lines as "already linked to another supplier" when the supplier product only appears in a store's stock and purchasable items or finished products lists.

· **#56290**: Supplier products exported as not orderable, or with decimal quantities allowed, now keep this setting when the

exported file is imported again (Supplier products and Smart catalog client prices imports).

· **#50788**: Translated product family import no longer fails with a "Forbidden parameter" error when Spanish (Peru) is an active language.

· **#56840**: Product and supplier product imports again file each item under the family that contains its sub-family when several product families share the same name, instead of showing family "None" with the family name as sub-family.

· **#56353**: Inactive pricelists are no longer included in the supplier product export, so they are no longer made active again when the file is imported into another environment. A full supplier product import no longer removes the article prices of inactive pricelists that have no end date.

· **#57745**: Fixed the supplier product import never finishing on large files (tens of thousands of lines), which left the import stuck before any data was checked or imported.

Interfaces

Features

· **#55799**: ✔ The Ma Cantine diagnosis now uses the actual origin recorded on received batches when all the batches of a received product share the same origin and cover the whole received quantity; otherwise it uses the theoretical origin (it was not yet active in version 0.830.0).

Mapal OS

Bug fixes

· **#54743**: Fixed the legacy product switcher sometimes showing no available applications on V1 pages.
