

Easily 0.820.0

2026-10-12

The changes and bugs corrected in versions 0.815.1, 0.815.2, 0.815.3 and 0.815.4 are included in this version.

General

Features

- **#53167**: 🐛 Mapal AI Assistant configuration now uses MAPAL_AI_ASSISTANT_ENV (dev, pre or pro) instead of MAPAL_AI_ASSISTANT_API_URL when updating to version 6.3.1.
- **#54545**: 🐛 Admin APIs: updated DEL /pos-products with new parameters to filter which products to delete: idPOSProducts (restrict to a list of ids), idSiteOwner (restrict to products owned by a site), onlyUnmapped (products with no recipe mapping instead of products mapped to an empty recipe), onlyIgnored (restrict to ignored products), dateCreatedFrom/dateCreatedTo (creation date range), deleteEmptyRecipe (also delete the linked empty recipe when possible), preview (return what would be deleted without deleting anything).

Bug fixes

- **#54492** (V0.815.2): Disabled async tasks service to avoid issues leading to every page being inaccessible for some profiles.
- **#54492** (V0.815.2): 🐛 When an error occurs while building the application, display an error to try again instead of caching the app with empty routes.
- **#54492** (V0.815.3): 🐛 Completely remove the async task feature and the pg-boss library.
- **#55321**: Fixed a bug that prevented the supplier-product-v2 fieldsNotToUpdate import matching rules from being applied when re-importing the file.

Home

Features

- **#48617**: ✔ Pasting images into information messages is no longer allowed; a warning explains that this is for technical reasons, while text and formatted content can still be pasted.

Site parameters

My budgets

Features

- **#51922**: ✔ A cost calculation mode can be chosen for the site: weighted unit cost (default) or cumulative service cost.

Sites

Site settings

Features

- **#54565**: ✔ Moving a site is now refused when a recipe tag on that site or on one of its child sites would no longer belong to a site in its hierarchy. The move screen lists the tag, the site carrying it, and the site that owns it, and does not offer to continue.

Rights Management

Features

- **#50305**: ✔ **Rights Management and My rights are now available to customers.** The beta label is gone from these screens and from their rights.
- **#51892**: ✔ Rights Management can show a description for each screen and right (in addition to the label).
- **#52111**: ✔ Rights now show their functional sub-categories (Report, Integration, Security, Analytics, Help, Cron, Devices Management) in the Profiles and Comparator tabs, and administrators can filter rights by sub-category.
- **#52080**: ✔ Super admin (adminIdeolys) can see a GDPR badge (with the reason on hover) on rights that involve GDPR-sensitive data, and can filter the list to those rights only. The badge and the filter are not shown on My Rights or to other users.

Bug fixes

- **#54930**: On the Profiles tab, the user's own profile is now selected by default (falling back to the first profile) and the filter button is disabled while no profile is selected.
- **#50283**: ✔ In Rights Management, the profile selection lists ("Copy rights from another profile" window and the profiles to compare) now have the same width as their field, and long profile names are truncated.
- **#54757**: Reduced delays in the Comparator when loading profiles, searching, filtering, expanding or collapsing sections, changing rights and saving. If saving fails for some profiles, their unsaved changes are kept for retry.

Rights changes

- **#54757**: Right "See the allowed pages and actions of several profiles" has been added.

Products

Suppliers

Features

- **#53023**: 🐛 Supplier localization tags are validated on save instead of a database check, so database restores are no longer blocked by that constraint.

Recipes

Recipes management

Bug fixes

- **#52778**: Fixed an issue in simulation mode: clicking a sub-recipe did nothing when the simulation was not fully set up (for example, no meal type selected). The click now opens the simulation options window; once the simulation is configured, the sub-recipe is shown read-only below its parent recipe.
- **#51730**: Fixed the yield coefficient not being applied in recipe sheets: net and gross ingredient quantities now take it into account, including when printing several recipes or changing the number of portions.

Customers

Order cutoff schedules

Features

- **#40127**:  Custom order cutoff schedules can be deleted from the list.

Rights changes

- **#40127**: Right "Delete a custom order cutoff schedule for a site" has been added.

Menus

Menus

Features

- **#51923**:  In the performance indicators window, the unit cost price follows the site's cost calculation mode; the other indicators and the target row are unchanged. The menu financial reports (by category and by site) also provide the cumulative service cost.
- **#50126**:  Optimized menu report generation by aggregating products, certifications, and allergens before joining them, reducing intermediate result size and PostgreSQL sort memory. The complete JavaScript report object shape is now documented for consumers.
- **#51922**:  The cost of the days and of the week follows the cost calculation mode of the site, the other cost staying available in the tooltip.

Bug fixes

- **#11308**: Fixed an error preventing some menus from being copied into a destination menu frame that already contains recipes.

Menu quantities v2

Features

- **#10989**:  When all recipes of a menu are at 0 (for example after resetting headcounts), recipe headcounts are now distributed using the menu template's take-up rates when enabled, instead of each recipe receiving the menu headcount.
- **#11235**:  A context (reason and comment) can be entered on a consumption day, for the whole site or for a given menu.
- **#43474**:  The reasons available when entering a context can be administered from the context panel.

Rights changes

- **#43474**: Right "Create a context reason" has been added.
- **#43474**: Right "Update a context reason" has been added.
- **#43474**: Right "Delete a context reason" has been added.
- **#11235**: Right "List the contexts of a consumption day (site or menu)" has been added.
- **#11235**: Right "Create the context of a consumption day (site or menu)" has been added.
- **#11235**: Right "Update the context of a consumption day (site or menu)" has been added.
- **#11235**: Right "Delete the context of a consumption day (site or menu)" has been added.
- **#11235**: Right "List the context reasons" has been added.

Smart Specifications

Bug fixes

- **#52706**: Fixed an issue where the diets selected on an allergen-based Smart Particularity rule were not saved when saving while the diet dropdown was still open.

Supplier orders

Order preparation v2 BETA screen not yet available

Features

- **#53158**:  From the order preparation home page, "New template" lets users prepare their orders as usual and, when launching the calculation, save the chosen criteria (without the period) as a template shared with the site or kept private.
- **#53159**:  The order preparation home page lists the templates of the site visible to the user (name, needs source, number of sites, last launch, sharing). Selecting a template opens the preparation pre-filled with its criteria, which can still be changed before launching; the last launch of the template is only updated when its criteria were not changed.
- **#53160**:  "Properties" and "Delete" options in a template's action menu: rename the template, change its sharing (creator only) or delete it (it disappears from the list and can no longer be recovered from the application).
- **#53161**:  "Edit" option in the template action dropdown: edit the criteria, then save the template and/or launch the

calculation.

- **#53364:** ⚠️ Order preparation v2 results now display products in a configurable table with expandable delivery rows.
- **#52878:** ⚠️ Order preparation v2 results are now split into three tabs — “To process” (orderable and non-orderable products, with dedicated filters and order generation), “Needs covered” and “Added to basket” — and the obsolete “Show only” product filter has been removed.
- **#52875:** ⚠️ In order preparation v2 results, non-orderable products now show why (for example: no compatible delivery date, supplier holiday, pre-order delay not met, quantity below the minimum). The site list shows a counter of products in error and products outside the Smart Selection are flagged.

Bug fixes

- **#51353:** ⚠️ Closing the search field now clears the search. Reloading the page no longer keeps a hidden filter.

Rights changes

- **#53158:** ⚠️ Rights “List the order preparation templates”, “Create an order preparation template” and “Record the launch of an order preparation template” have been added to the order preparation page.
- **#53159:** ⚠️ Right “Retrieve an order preparation template” has been added to the order preparation page.
- **#53160:** ⚠️ Rights “Update an order preparation template” and “Delete an order preparation template” have been added to the order preparation page.

Supplier orders

Features

- **#50329:** ✓ In Supplier orders, the colored indicator at the start of each card now shows, right in the list, which orders need action (for example supplier holiday, non-orderable product, quantity below the minimum), with the detail of the errors on hover. The order comparison action is now in the order detail, to the left of the report print button, instead of appearing when hovering the card.

Bug fixes

- **#50466:** An order paid by external payment card can no longer be sent to the supplier while its authorization reference and authorization code are missing.
- **#50466:** 🛠️ The SB2 server to server payment notification (POST /interfaces/sb2/callback) is enabled by the config key SERVER_INTERFACES.sb2.paymentPage.isCallbackEnabled (disabled by default).

Track orders

Features

- **#50329:** ✓ In Track orders, unsent order cards now show the same validation indicator as Supplier orders: hovering lists the detected errors and warnings, clicking opens the order. The list is also more compact, with dates shown on one line.

Receptions

Bug fixes

- **#54699:** 🛠️ For suppliers where receipt valuation is not based on the market price on the delivery date, a manual reception without a linked order now reports the supplier price without markup in line with the applicable price list, while the delivered price, receipt totals and stock valuation stay as entered.
- **#48276:** Unchecking “Update stock” on a product no longer unchecks it on the products added afterwards.

Supplier invoices

Bug fixes

- **#54205** (V0.815.1): Fixed the application failing to start for users whose profile does not give access to supplier invoices.
- **#50126:** External invoice imports no longer crash when invoice data is missing or invalid: the remaining invoices are still processed and the context is logged for diagnosis.

Production

Production management

Bug fixes

- **#53035:** Fixed a bug that allowed a product to be selected even when its quantity was empty.

Shipment

Packaging and logistics

Bug fixes

- **#51890:** Sub-recipes packaged separately and produced on a different day than their main recipe (because of another workshop’s time lag or a manual date change) now appear in the packaging report for their own production day.

Stock

Known losses and markdowns

Bug fixes

- **#45979:** The detail of a loss no longer displays the “Not computed” message when the material costs have been computed, and the costs are now displayed with 3 decimals.

Tools

Imports / Exports

Features

- **#53195**: ✓ Pricelist import now supports fieldsNotToUpdate for priceBillingUnit, isOrderable and labelPricelist.

Bug fixes

- **#52154**: Recipe import no longer fails when a primitive recipe and a declined recipe share the same element. On the primitive recipe, values missing from the file stay as they are, an empty custom field clears only that field, and keeping one custom field unchanged no longer blocks the others; declined recipes stay unchanged.
- **#53215**: 🛠 Improved import performance for large files (products) by resolving entity identifiers once.
- **#53211**: Fixed a false "La sous-famille ne correspond pas à la famille" rejection in product / supplier-product imports when several unrelated families share the same external identifier (extId); the check now relies on the sub-family's actual parent family.
- **#54416**: Client price imports now include the end date of each price period, so client prices remain applied on their last valid day instead of ending one day early.
- **#53120**: The supplier product export now writes the real last day of a price validity period, so the end date no longer moves one day later after exporting and reimporting the file.

Interfaces

Features

- **#47041**: ✓ Map additional Agrilocal labels (EQU, EPD, RUP, HV1/HV2/HVE from produitHve string values) into product certifications and variant PI.
- **#52756**: 🛠 Orion integrations now use Crous API credentials and the Orion Connect endpoint.
- **#52756**: 🛠 Orion is enabled by the presence of SERVER_INTERFACES.orion. The Crous settings move to SERVER_INTERFACES.CROUS (apiUrl, tokenUrl, clientId), with the client secret in SERVER_INTERFACES_CROUS_CLIENT_SECRET.

Bug fixes

- **#51829** (V0.815.4): Orion invoice certification no longer fails when a sub-cent amount difference requires no legal commitment complement.
- **#54266**: Ouilink supplier invoice import now completes correctly when there are no invoices to retrieve, instead of running indefinitely.
- **#51829**: Orion invoice certification no longer fails when a sub-cent amount difference requires no legal commitment complement.
- **#47041**: 🛠 When receiving Agrilocal products with the same supplier, code and name but different labels or origin, a new product identifier is created instead of adding labels to the existing product.

Mapal OS

Bug fixes

- **#50234**: Profiles created, renamed or deleted in MapalOS are now reflected immediately in the Easyls profile list, deleted profiles without users are deactivated, and linked profiles can be populated from another profile.
