

Easily 0.825.0

2026-10-26

The changes and bugs corrected in versions 0.820.1 are included in this version.

General

Features

- **#53143:** 🛠 The legacy embedded help is removed: the "i" button is no longer displayed.
- **#53508:** 🛠 Scheduled jobs are not stopped at their time limit: they log an error and keep their lock until they finish, so a stuck job blocks the next run until restart. Limits stay 24 hours, or 6 hours for menu item cost, 30 minutes for analytics sync and 15 minutes for supplier order status checks; a crashed run is retried only after that limit expires.

Bug fixes

- **#56253** (V0.820.1): The menu items data is now extracted month by month during the Analytics synchronization, and the "Nutrition families" field is no longer available in the Menus cube, to prevent the synchronization from failing for large customers and leaving their dashboards empty.
- **#53167:** The Mapal AI assistant now loads on new-generation screens as soon as the page opens, instead of sometimes not appearing.
- **#55487:** 🛠 Fix technical log.
- **#55487:** Fixed an error that could prevent faxes from being sent when the fax service is configured to use the interfax API.

Sites

Rights Management

Features

- **#21008:** ✔ On the Profiles tab, you can now open the list of a profile's users by clicking the eye icon in front of their count (until now, only the count was displayed). The panel lists the users of the current site (last name and first name) and those of child sites (last name, first name and site). The icon is only visible to users granted the corresponding right.
- **#54909:** ✔ In the Comparator, hovering a screen or right row that has an availability version now shows a blue information icon with a tooltip "Available from version: X".

Bug fixes

- **#54756:** In the Profiles tab, the action type of each right is now displayed as a coloured icon (identical to the Comparator tab) instead of a coloured text label, improving readability.
- **#54871:** In the Comparator, a row can now be expanded by clicking anywhere on the row, not just the small arrow.
- **#54918:** Inside a screen, rights are now sorted alphabetically in the language of the user, in the Profiles tab and in the Comparator. The order is stable across imports and language changes.
- **#54919:** In the filter panel, a version chosen in "Since the" or "Up to the" can be cleared back to "All versions" without resetting the other filters. This applies to Screens and Rights, on the Profiles tab and in the Comparator.
- **#54928:** In the Comparator, create rights now show the + icon and update rights show the pencil, matching the Easily conventions.
- **#54796:** On the Profiles tab, the profile actions button, previously a small "..." with no background that was hard to spot, is now a round button that is easier to see, and its name ("Profile actions") is displayed on hover.
- **#54789:** Usability improvements to make the Rights Management screen easier to understand, including a tooltip on the "All profiles" column of the Comparator and explanations of the Enabled / Disabled filters.

Rights changes

- **#21008:** Rights "See the users of a profile on the current site" and "See the users of a profile on child sites" have been added.

Products

Suppliers

Bug fixes

- **#53024:** Fixed the gear button next to "EDI Code / Unit" in the supplier sheet, which did not open the EDI codes list.

Recipes

Recipes management

Features

- **#55595:** ✔ When a recipe is simulated, the origins of the industrial products used are now listed.

Smart Grammage

Rights changes

- **#54508:** Right "View meal types available to smart basis weight rules" has been added.

Customers

Customer contracts BETA 🚫 screen not yet available

Features

- **#43777**: 🚫 Added the general setup management of a customer contract offering.
- **#43778**: 🚫 Customer contract offerings support attachments; contract and offering documents are visible only on the owner site.

Bug fixes

- **#56432**: A newly created contract now opens on its own page, deleting a contract from its page deletes this contract only, and the contract search of the custom order cutoff schedules works.
- **#56431**: Contract and offering dates are no longer shifted by one day depending on the time zone.

Rights changes

- **#43778**: New rights "See the list of documents on a customer contract offering", "Send a document to a customer contract offering" and "Delete a document on a customer contract offering", available on the customer contracts page.

Menus

Menus

Features

- **#54508**: ✅ Menus and templates blocked by the technical meal type can be saved again. Their data is moved to a new meal type ending with "_tocheck", for the customer to check and rename.

Bug fixes

- **#54528**: Fixed cumulative service costs on the Menus screen to exclude meal types not included in the headcount and ignore unknown costs.
- **#55559**: 🐛 Fixed an error that could prevent menus from being exported to the interface.
- **#54527**: Fixed the performance indicators modal showing the weighted unit cost price instead of the cumulative service cost when the site uses the cumulative service cost mode.

Menu templates

Features

- **#54508**: ✅ A sales forecast template can no longer be duplicated or declined. Those actions stay disabled, and a tooltip explains that a sales forecast template cannot be duplicated.

Bug fixes

- **#50229**: Duplicating a menu template to another site now keeps its services when headcounts and take-up rates are not copied, allowing menus to be copied to the destination site.

Copy menus

Features

- **#54508**: ✅ A sales forecast template can no longer be copied to another template or to other sites.

Guest orders

Guest orders

Features

- **#54508**: ✅ An order is refused when it uses the reserved meal type. An order without a meal type uses meal type 1 when no other meal type matches the dish.

Supplier orders

Order preparation v2 BETA 🚫 screen not yet available

Features

- **#55439**: ⚠️ The supplier filter is no longer in the general panel: each site now has its own supplier filter in its own panel, and it applies to that site only. The general button now only sorts the products, with the same sort for every site. The site search ignores accents and case.

Bug fixes

- **#55441**: The suppliers selected in the filter now stay displayed when the filters panel is reopened.
- **#55452**: The site search in the preparation form now finds sites regardless of accents and word order.
- **#55517**: Fix unwanted order multiple warnings on delivery day quantities: the check and the input are now done in order units instead of production units.
- **#55451**: After generating supplier orders, the "In cart" and "Available" quantities are now updated immediately, without reloading the page.

Track orders

Features

- **#53323**: ✅ Comments added to ordered products are now displayed on the supplier order details in Track orders.

Supplier orders

Features

- **#55487**: 🐛 Mailjet API base URL is now the configuration key EMAIL_MAILJET_URL (default https://api.mailjet.com).

Credit note requests

Bug fixes

- **#45397**: A credit note request is now ended as soon as the supplier invoice is entered or associated on its credit note, or when the credit note leaves "To receive" (a refused request stays refused).

Invoices

Bug fixes

- **#45397**: Accepting or refusing a credit note request no longer changes the status of its credit note once the supplier invoice has been entered or associated, or once the credit note has reached "To validate".

Supplier invoices

Features

- **#53239**: ✓ The invoice export for integration now exposes an `isFromStockTransfer` flag on each invoice, set to true when the invoice is linked to a stock transfer through its receipt, supplier order or claim.

Bug fixes

- **#48616**: On an invoice generated from a claim, the unit price of a product line is now the requested compensation spread over the received quantity, instead of the difference between the delivered and ordered prices.

Supervision of order dispatch

Features

- **#53315**: ✓ Sent orders can be filtered by supplier type, to distinguish internal suppliers (sites) from external suppliers.

Production

Production

Bug fixes

- **#47847**: The outbound transactions by storage zone report now includes Smart Packaging rounding.

Shipment

Smart packaging

Bug fixes

- **#44695**: Smart Packaging: the completion of partially filled containers is now computed from the guest grammage (the smallest one when several are grouped) instead of the recipe reference weight.

Packaging and logistics

Features

- **#55622**: 🛑 The packaging plan now shows, under each recipe, its allergens ("Allergens: ..." or "No allergens") and, when there are any, its traces ("May contain traces of: ..."). Only the production site's allergens are taken into account. For a past date, the historized allergens are used (traces are not historized yet); for today and future dates, they are computed live. Not yet available to customers: the feature is only enabled on development environments.

Tools

Imports / Exports

Features

- **#56417**: ✓ Generic, supplier-product and supplier-product-v2 imports support additional `fieldsNotToUpdate` options on update: product link, billing and order multiples, unpackable flag, and generic family / production unit.

Bug fixes

- **#54272**: Supplier product import (v2): a product already linked to another supplier of the same hierarchy (parent, child, or attached to the same parent) is no longer rejected. It is still rejected if linked to a supplier of a different hierarchy. Expired links no longer block the import. In a full import, a product whose line is rejected is no longer deactivated, which made the same file alternate between success and failure.
- **#54879**: Supplier and supplier-site imports no longer overwrite the order lead time, the delivery-before-production delay or the delivery days already set on child sites. A child site without delivery days now uses the ones of the supplier owner site (storehouses, needs, supplier orders).

Interfaces

Bug fixes

- **#56291**: Orion invoice certification now complements the legal commitment line with the total of all the invoice lines attached to it, and counts prior service fails even when their invoice is already paid, so the service fail always fits the legal commitment.
- **#56455**: 🐛 Orion invoice certification now has an E2E regression test for zero-amount standalone non-product charges, so a skipped charge cannot block the service fail from being sent.
- **#56456**: 🐛 Orion invoice and order validation errors are now logged with the failing step and the original database or HTTP cause; unexpected exceptions are no longer silent or logged as `[object Object]`.
