# Easilys 0.830.0

2026-11-09

*The changes and bugs corrected in version 0.825.1 are included in this version.*

## General

Bug fixes

· **#58152** (V0.825.1): Fixed the application crashing for users whose interface language is Italian.
· **#57621**: Fixed users with MAPAL OS sign-in being unexpectedly sent back to the home page after their session was renewed.
· **#57872**: 🔧 Fixed the repeated web server warnings in the application logs.
· **#57819**: 🔧 Fixed duplicated lines in the application logs.
· **#56739**: Fixed password reset from the "Forgot password" email link.
· **#58152**: 🔧 Improved the escaping of translations coming from Lokalise, to prevent errors such as the crash with the Italian language fixed in version 0.825.1.

## Site parameters

Users

Features

· **#56434**: ✔ French (RCM) is no longer available. Users who had it selected now use French. Import columns for that language are removed.

## Sites

Rights Management

Features

· **#56623**: ✔ In the Comparator, the filter "Rights disabled on" shows rights that are off on the chosen profile and on for at least one other compared profile. The chosen column stays in place, and a pin icon explains that it is used by this filter.

Bug fixes

· **#56623**: In the Comparator, "Show differences only" now hides screens and modules that have no differing rights, instead of leaving them empty.
· **#55485**: In the Profiles tab, a screen or right description is shown beside a blue information icon instead of inside a blue banner. "Available from version" is written smaller and in grey.
· **#54750**: In the Profiles tab, searching by right label no longer reduces the profile list to the selected profile — all profiles stay visible and selectable, and switching to another profile shows the matching rights for that profile.
· **#54759**: In the Comparator, unsaved changes are now flagged with a red dot on the modified cell and an "N modif." counter on right and screen/group rows, instead of yellow hatching.
· **#54747**: In the Profiles and Comparator tabs, checking or unchecking a right shared by several screens immediately updates every occurrence before saving. Discarding changes restores its saved state everywhere.
· **#55483**: In the Profiles tab, the switch in front of each screen now has only two states, on and off: the "partial" state, shown when only some of the screen's rights were checked, is removed.
· **#56997**: After screens or rights are changed in the Profiles tab or Comparator, connected users are warned to save their work and reload to receive the updated access without logging out.

## Products

Smart Catalogue®

Bug fixes

· **#50493**: After a Smart Catalogue import, products with no end date stay available on child sites, and recipe valuation using them is correct again.

Suppliers

Bug fixes

· **#56833**: In the supplier sheet, after modifying a code in the "EDI codes for units" panel, the line now goes back to read mode once validated.

## Recipes

Recipes management

Features

· **#45102**: ✔ Production workshops used by recipes can now be deleted. Recipes are reassigned to the default "Unknown" workshop. If the workshop has production time lag rules, the confirmation dialog lists them and lets the user explicitly delete or migrate them. Migration is blocked when rules conflict with those on the replacement workshop.

## Customers

Customer contracts BETA ⛔ screen not yet available

Features

· **#25581**: ✔ A contract linked to sites or offerings can no longer be deleted (the "Delete" action is disabled with an explanatory message), the deletion confirmation now names the contract, and local contracts are identified by a map marker icon in the list.

Bug fixes

· **#56430**: An offering can no longer be saved with dates outside the dates of its contract, and the dates of a contract can no longer be changed in a way that leaves one of its offerings outside them.

· **#57021**: The "Cancel" button is now available as soon as you edit an existing contract.

## Menus

Menus

Features

· **#56945**: ✔ Past menus (menu list and menu report) now show the allergen traces as they were on the day, kept each night with the allergens. Menus of dates frozen before this release show no traces.

Menu quantities v2

Features

· **#47946**: ✔ Add the "Nutritional menu" report to the headcount entry screen, for the menu selected in the screen, so that child-site users no longer need the Menu screen.

· **#47947**: ✔ Add the "Detailed nutritional menu" report to the headcount entry screen, for the menu selected in the screen, with the period, meal type and dish filters. This report relies on a dedicated API: no financial data (costs, prices, margins) of the central kitchen is sent to child sites.

· **#57772**: 🔧 The "Menu week", "Menu day A4" and "Multi-category consolidated menus" reports of Headcount Entry now use the same data as the matching Menu screen reports (recipes, allergens, labels). These reports still show no cost or price, and now use their own templates.

Bug fixes

· **#55550**: In Headcount Entry, the Duplicate button is now disabled, with a tooltip explaining the missing right, for users whose profile does not have the right to duplicate a reference period. Removing this right from a profile now takes effect.

Rights changes

· **#47947**: Right "View the detailed nutritional menu for a period" has been added.

· **#56261**: Descriptions have been added to the 10 Menu quantities rights that had none, so they are now displayed in Rights Management.

## Guest orders

Consolidated allergen management

Features

· **#56640**: ✔ Integrators can request consolidated allergens for dishes on a menu with no headcount, so resident menus can show allergens before orders are placed. Results remain unchanged unless requested.

## Supplier orders

Order preparation v2 BETA ⛔ screen not yet available

Bug fixes

· **#51844**: When several guest types share the same packaging and a filling threshold applies, order needs are no longer understated: they now match the packaging plan.

Supplier orders

Bug fixes

· **#52184**: The delete cross and edit pencil are now displayed on every line of the order basket as soon as it is opened, without having to close and reopen it.

· **#56405**: After accepting an order, the supplier orders list now shows the up-to-date status of the order as soon as the order has been sent, without having to reload the page.

Receptions

Features

· **#55796**: ⛔ When entering batches on a receipt, users can now record the actual origin of the delivered goods: new batches are prefilled with the product's origin, existing batches show the origin saved on them, and the product's origin itself stays unchanged. The product's theoretical origin is shown in the product information. This feature is not active yet: it is hidden behind a feature flag.

Rights changes

· **#55796**: ⛔ Right "Allow editing the origin of a received product" now also allows changing the actual origin of batches in Receptions. This feature is not active yet: it is hidden behind a feature flag.

Control on reception

Features

· **#55796**: ⛔ The batch origin field is now called "Actual origin", and existing batches show the origin saved on them (unknown if none was recorded) instead of the product's origin. A new batch saved without an origin gets the product's origin. This feature is not active yet: it is hidden behind a feature flag.

## Production

Production

Bug fixes

· **#51844**: When several guest types share the same packaging and a filling threshold applies, production reports and outbound transaction reports no longer understate recipe and ingredient quantities: they now match the packaging plan.

## Stock

Stock

Features

· **#53610**: ✔ When a sale uses a recipe ingredient, the stock is now removed first-in first-out from all the products linked to this ingredient, instead of only the product chosen for the recipe.

Known losses and markdowns

Features

· **#53610**: ✔ The loss of a recipe now removes the stock of its ingredients first-in first-out from all the products linked to each ingredient.

## Tools

Imports / Exports

Features

· **#56984**: ✔ Product import `fieldsNotToUpdate` accepts `product_family` or `product_family_extId`, and `product_subFamily` or `product_subFamily_extId`. Either name ignores a known external id and its label, and does not block the other level. An unknown parent external id still creates that family and links the product.

Bug fixes

· **#54807**: Supplier import now applies an order limit time imported without an order lead time (in days) and keeps the lead time already set on the supplier. The supplier export now shows the minutes of the order limit time.

· **#56984**: Product import `fieldsNotToUpdate` now skips `Product.idProductCategory` when `product_category` is listed.

Interfaces

Features

· **#55799**: ⛔ The Ma Cantine diagnosis now uses the actual origin recorded on received batches when all batches of a received product have the same origin and cover the whole received quantity. Otherwise it uses the theoretical origin shown in Receptions (supplier product origin, else product origin). This feature is not active yet: it is hidden behind a feature flag.

Bug fixes

· **#53271**: JES: sales are now fetched for each site from the date of its last saved sale (maximum 7 days in the past, configurable with `maxDaysInPast`) and always from 00h of that date, so that a site that missed a run catches up and the first hours of the day are no longer skipped. A failing site no longer stops the import, and logging, error handling and the routing rules cache were improved to reduce SQL queries.
